

UNIVERSITY OF CAMBRIDGE INTERNATIONAL EXAMINATIONS  
 General Certificate of Education  
 Advanced Subsidiary Level and Advanced Level

CANDIDATE NAME

CENTRE NUMBER

CANDIDATE NUMBER

**CHEMISTRY** **9701/52**  
 Paper 5 Planning, Analysis and Evaluation **October/November 2011**  
**1 hour 15 minutes**

Candidates answer on the Question Paper.  
 No Additional Materials are required.

**READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in.  
 Write in dark blue or black pen.  
 You may use a soft pencil for any diagrams, graphs, or rough working.  
 Do not use staples, paper clips, highlighters, glue or correction fluid.  
**DO NOT WRITE IN ANY BARCODES.**

Answer **all** questions.  
 You are advised to show all working in calculations.  
 Use of Data Booklet is unnecessary.

At the end of the examination, fasten all your work securely together.  
 The number of marks is given in brackets [ ] at the end of each question or part question.

For Examiner's Use

<b>Total</b>	

This document consists of **8** printed pages and **4** blank pages.

- 1 When potassium nitrate dissolves in water, the temperature of the solution goes down because the enthalpy of solution is endothermic.

You are to plan an experiment to investigate how the solubility of potassium nitrate varies with temperature. The units of solubility are grams per one hundred grams of water (g/100g water).

- (a) (i) Predict how the solubility of potassium nitrate will change if the solution temperature is **increased**.

Explain your prediction using the fact that dissolving potassium nitrate is endothermic.

prediction .....

.....

explanation .....

.....

.....

.....

- (ii) Display your prediction in the form of a sketch graph, labelling clearly the axes.

[3]

- (b) In the experiment you are about to plan, identify the following.

(i) the independent variable .....

(ii) the dependent variable .....

[2]

- (d) State a hazard that must be considered when planning the experiment and describe precautions that should be taken to keep risks to a minimum.

*For  
Examiner's  
Use*

.....  
..... [1]

- (e) Draw a table with appropriate headings to show the data you would record when carrying out your experiments and the values you would calculate in order to construct a graph to support or reject your prediction in (a). The headings **must** include the appropriate units.

[2]

[Total: 15]

- 2 Chemical reactions occur more rapidly as the temperature of the reaction mixture increases. The mathematical relationship that summarises this is

For  
Examiner's  
Use

$$\log_{10} (\text{rate of reaction}) = \frac{-E_A}{19T}$$

where  $E_A$  is the **activation energy** of the reaction and  $T$  is the **absolute temperature** in Kelvin and the **rate of reaction** can be taken as the reciprocal of the time taken in seconds (**1/time**).

An experiment was carried out to investigate this relationship using dilute hydrochloric acid and aqueous sodium thiosulfate.

- 20 cm<sup>3</sup> of dilute hydrochloric acid was placed in a boiling tube contained in a water bath.
- 20 cm<sup>3</sup> of aqueous sodium thiosulfate was added to the dilute hydrochloric acid, while stirring and a stopwatch started.
- The temperature of the water bath was recorded.
- After a period of time the liquid became cloudy (opaque) due to the formation of a precipitate of sulfur.
- As soon as this cloudiness (opacity) appeared the time was recorded.
- The temperature of the water bath was raised and the whole experiment repeated.

- (a) The results of several such experiments are recorded below.

Process the results in the table to calculate **log<sub>10</sub> (rate of reaction)**, the reciprocal of the absolute temperature (**1/T**) and the 'rate of reaction' (**1/time**). You should expect the values of **log<sub>10</sub> (rate of reaction)** to be negative.

Record these values to **three significant figures** in the additional columns of the table.

Label the columns you use. For each column you use include units where appropriate and an expression to show how your values are calculated.

You may use the column headings A to F for these expressions (e.g. A–B). [3]

A	B	C	D	E	F
temperature /°C	absolute temperature /K	time /s			
20.0	293	60.3			
30.0	303	46.8			
40.0	313	41.6			
45.0	318	31.6			
50.0	323	28.8			
55.0	328	25.1			
60.0	333	21.0			
65.0	338	20.4			
70.0	343	18.1			
80.0	353	15.1			

- (b) Plot a graph to show the relationship between  $\log_{10}$  (rate of reaction) and the reciprocal of the absolute temperature. You are reminded that the values for  $\log_{10}$  (rate of reaction) are negative.  
Draw the line of best fit.

[3]

- (g) By considering the movement of particles in the reaction explain why the rate of reaction increases with increasing temperature.
