Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided
 - there may be more space than you need.

Information

- The total mark for this paper is 80.
- The marks for each question are shown in brackets
 use this as a guide as to how much time to spend on each question.
- In the question marked with an asterisk (*), marks will be awarded for your ability to structure your answer logically, showing how the points that you make are related or follow on from each other where appropriate.
- A Periodic Table is printed on the back cover of this paper.

Advice

- Read each guestion carefully before you start to answer it.
- Show all your working in calculations and include units where appropriate.
- Check your answers if you have time at the end.

SECTION A

Answer ALL the questions in this section.

You should aim to spend no more than 20 minutes on this section.

For each question, select one answer from A to D and put a cross in the box ⊠. If you change your mind, put a line through the box ₩ and then mark your new answer with a cross ⋈.

1 Calcium carbonate reacts with hydrochloric acid.

$$CaCO_3(s) + 2HCl(aq) \rightarrow CaCl_2(aq) + H_2O(l) + CO_2(q)$$

Which factor does **not** affect the rate of this reaction?

- A concentration
- B pressure
- C surface area
- D temperature

(Total for Question 1 = 1 mark)

- 2 The rate of a reaction doubles for each 10 K increase in temperature. If the temperature of this reaction is increased from 298 K to 358 K the rate of the reaction increases by a factor of
 - A 6
 - B 12
 - C 36■ D 64

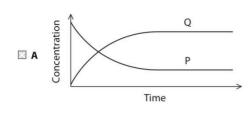

(Total for Question 2 = 1 mark)

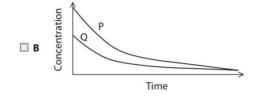

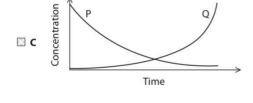

3 A large amount of P is added to a small amount of Q. A reversible reaction occurs in which P reacts to form Q.

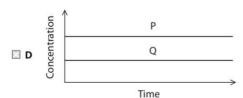

$$P \rightleftharpoons Q$$

Which graph shows how the concentrations of P and Q change as the reaction reaches equilibrium?

(Total for Question 3 = 1 mark)

3

Turn over ▶

- **4** Which equilibrium shifts to the right-hand side when the pressure in the system **decreases** at constant temperature?

 - \blacksquare **B** $F_2(g) + H_2(g) \rightleftharpoons 2HF(g)$

- (Total for Question 4 = 1 mark)
- 5 Potassium chloride reacts with concentrated sulfuric acid, producing misty fumes. It can be deduced that
 - A sulfuric acid is acting as an oxidising agent
 - **B** chloride ions are acting as an oxidising agent
 - C hydrogen chloride is formed in the reaction
 - D chlorine is formed in the reaction
- (Total for Question 5 = 1 mark)
- 6 The oxidation number of sulfur in the sulfate ion, SO₄²⁻, is

 - B +4

 - D + 8

(Total for Question 6 = 1 mark)

- 7 Which of these is a disproportionation reaction?
 - \square A 2NaOH + H₂SO₄ \rightarrow Na₂SO₄ + 2H₂O
 - \blacksquare **B** 6NaOH + 3Br₂ → 5NaBr + NaBrO₃ + 3H₂O
 - \square **C** 2NaOH + 2Al + 2H₂O \rightarrow 2NaAlO₂ + 3H₂
 - \square **D** NaOH + CO₂ \rightarrow NaHCO₃

(Total for Question 7 = 1 mark)

(Total for Question 8 = 1 mark)

- Which of these sulfates is the **least** soluble in water?
 - A CaSO₄■ B BaSO₄
- ☑ D Rb₂SO₄
- Use the data shown.

$$CH_4(g) + 2F_2(g) \rightarrow CF_4(g) + 2H_2(g)$$
 $\Delta H^{\oplus} = -858 \text{ kJ mol}^{-1}$

$$C(s) + 2F_2(g) \rightarrow CF_4(g)$$
 $\Delta H^{\oplus} = -933 \text{ kJ mol}^{-1}$

What is the standard enthalpy change of formation of methane (CH₄) in kJ mol⁻¹?

- That is the standard endularly endings of formation of medianic (ci.,,, missing)

■ B -75

☑ D +1791

(Total for Question 9 = 1 mark)

10 Chlorine reacts with ethane to form chloroethane and hydrogen chloride.

$$Cl_2 + C_2H_6 \rightarrow C_2H_5Cl + HCl$$

| Bond | Bond enthalpy / kJ mol ⁻¹ | | | | | | |
|-------|---|--|--|--|--|--|--|
| C—Cl | 346 | | | | | | |
| С—Н | 413 | | | | | | |
| Cl—Cl | 243 | | | | | | |
| H—Cl | 432 | | | | | | |
| C—C | 347 | | | | | | |

What is the enthalpy change for the reaction, in kJ mol⁻¹?

- ☑ B -122
- □ D +1434

(Total for Question 10 = 1 mark)

- 11 Which equation represents the standard enthalpy change of atomisation of bromine?
 - \square **A** $Br_2(g) \rightarrow 2Br(g)$
 - \square **B** Br₂(l) \rightarrow 2Br(g)
 - \square **C** $\frac{1}{2}Br_2(l) \rightarrow Br(g)$
 - \square **D** $\frac{1}{2}Br_2(q) \rightarrow Br(q)$

(Total for Question 11 = 1 mark)

12 In an experiment, $50.0\, cm^3$ of $1.0\, mol\, dm^{-3}$ HCl(aq) reacts with $50.0\, cm^3$ of $1.0\, mol\, dm^{-3}$ NaOH(aq).

The energy released = 2500 J.

The specific heat capacity of the mixture is $4.18\,\mbox{Jg}^{-1}\,\mbox{°C}^{-1}$

What temperature change occurs in the reaction?

- A an increase of 6.0°C
- **B** a decrease of 6.0°C
- ☑ C an increase of 12.0°C
- ☑ D a decrease of 12.0°C

(Total for Question 12 = 1 mark)

- 13 Which of these species is **not** a nucleophile?
 - A NH₄
 - B CN⁻
 - C H₂O
 - ☑ D CH₃NH₂

(Total for Question 13 = 1 mark)

14 Which of these isomers has the **highest** boiling temperature?

(Total for Question 14 = 1 mark)

- 15 A white solid, X, gives a red colour in the flame test and a cream precipitate forms when acidified silver nitrate solution is added to a solution of X.

 (a) What is the white solid, X?

 (1)

 A lithium chloride

 B calcium chloride

 C strontium bromide

 D barium bromide
 - (1)

 A electrons absorb blue and green light as they are promoted

 B electrons emit red light as they are promoted
 - $\ \square$ C blue and green light is absorbed as electrons return to lower energy levels
 - $\ oxdots$ red light is emitted as electrons return to lower energy levels

(b) What causes the flame colour to be red?

(Total for Question 15 = 2 marks)

- 16 This question is about hydrogen bonding.
- (a) Which property is **not** due to hydrogen bonding?

(1)

A ice has a lower density than water at 0°C

180°

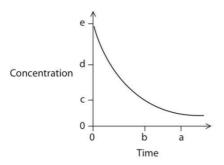

180°

- B hydrogen fluoride has a higher boiling temperature than hydrogen chloride
- C H—H bond enthalpy is greater than Si—H bond enthalpy
- D alcohols are less volatile than alkanes with a similar molar mass
- (b) Which diagram best represents a hydrogen bond between two water molecules?
- (1)

A HOH

(Total for Question 16 = 2 marks)

17 The graph shows how the concentration of a reactant changes with time.

Which expression gives the best estimate for the value of the rate of this reaction at time b?

- A b÷c
- **B** d÷a
- **区** e÷a
- D e ÷ b

(Total for Question 17 = 1 mark)

- **18** Which of these carboxylic acids would be expected to have a major peak at m/z = 57 in its mass spectrum?
 - ☑ A CH₃CH₂CH₂COOH
 - ☑ B CH₃COOH
 - ☑ C (CH₃)₂CHCOOH
 - ☑ D CH₃CH₂COOH

(Total for Question 18 = 1 mark)

TOTAL FOR SECTION A = 20 MARKS

SECTION B

Answer ALL the questions.

Write your answers in the spaces provided.

- 19 Iodine can be extracted from seaweed. The seaweed is heated strongly to burn off the organic matter. The resultant ash is boiled in water to dissolve the iodide ions, and the mixture is filtered.
 - (a) Acidified hydrogen peroxide (H₂O₂) is added to the filtrate. A redox reaction takes place with iodine and water as the only products.
 - Write half-equations for the oxidation and reduction reactions that take place.
 State symbols are not required.

(2)

(ii) Use your answers to (a)(i) to write the overall equation for this redox reaction. State symbols are not required.

(1)

| (b) The iodine is separated from the aqueous solution using solvent extraction. The aqueous solution is mixed with cyclohexane in a separating funnel, forming two layers. | |
|--|---------------|
| The mixture is then shaken gently and left until the layers separate. | |
| Most of the iodine dissolves in the cyclohexane layer. | |
| (i) State the colour of each layer after separation. | (2) |
| Aqueous layer | |
| Cyclohexane layer | |
| | |
| (ii) Explain why iodine is very soluble in cyclohexane but only slightly soluble in v | vater. (2) |
| | |
| | |
| | |
| | |
| (c) The cyclohexane layer is then removed from the separating funnel and dried. | |
| Identify, by name or formula, a suitable drying agent. | (1) |

- **21** The halogenoalkane 1-chlorobutane reacts under suitable conditions with potassium hydroxide to form the alcohol butan-1-ol.
 - (a) (i) Name a suitable solvent for the potassium hydroxide in this reaction.

(1)

(ii) State the type and mechanism of this reaction.

(1)

(iii) Draw the mechanism for this reaction.

Use curly arrows, and show relevant dipoles and lone pairs.

(3)

(b) A student carried out the reaction.

After separation and purification, the mass of but an-1-ol formed was 12.1 g.

The yield of the reaction was 64.0%.

Calculate the volume of 1-chlorobutane used in the reaction.

Give your answer to an appropriate number of significant figures.

[Density of 1-chlorobutane = $0.886 \,\mathrm{g \ cm^{-3}}$]

SECTION C

Answer ALL the questions.

Write your answers in the spaces provided.

- 23 Propanoic acid, CH₃CH₂COOH, is a colourless liquid used as a preservative in animal feed. Propanoic acid can be formed by oxidising the alcohol propan-1-ol.
 - (a) Write the balanced equation for the oxidation of propan-1-ol to form propanoic acid. Use [O] to represent the oxygen from the oxidising agent. State symbols are not required.

(1)

*(b) Propan-1-ol is heated with a concentrated solution of acidified potassium dichromate(VI).

Explain how the conditions used affect the rate of the reaction **and** ensure that propanoic acid is the only organic product.

(c) A student suggested using universal indicator to check for the presence of propanoic acid formed in the reaction mixture.

Give a reason why the result of this test is **not** likely to be conclusive.

(1)

(d) The permitted mass of propanoic acid used in animal feed is in the range $1000-3000\,\mathrm{mg\,kg^{-1}}$. A titration method may be used to check the concentration of propanoic acid in animal feed.

A 50.0 cm³ sample of propanoic acid solution was extracted from 50 g of an animal feed.

The sample was added to a volumetric flask and the volume made up to 250.0 cm³ and mixed thoroughly. A pipette was used to transfer 25.0 cm³ of the diluted acid into a conical flask containing an indicator.

The contents of the conical flask were titrated with a solution of sodium hydroxide, NaOH(aq), with concentration 0.00668 mol dm⁻³.

The procedure was repeated twice and the results obtained are shown.

| | Run 1 | Run 2 | Run 3 |
|-----------|-------|-------|-------|
| Titre/cm³ | 23.20 | 22.10 | 22.20 |

(i) Phenolphthalein is a suitable indicator for this titration.

State the colour **change** at the end-point.

(2)

| (ii) | Suggest two possible reasons why the titre for Run 1 is greater than the other two titres. | | | | | |
