Candidate surname	Other names				
Pearson Edexcel International GCSE (9–1)	e Number Candidate Number				
Wednesday 12 June 2019					
Morning (Time: 1 hour 15 minutes)	Paper Reference 4CH1/2CR				
Chemistry					
Unit: 4CH1 Paper: 2CR					
You must have: Calculator	Total Marks				

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
 - there may be more space than you need.
- Show all the steps in any calculations and state the units.
- Some questions must be answered with a cross in a box ⋈. If you change your mind about an answer, put a line through the box ⋈ and then mark your new answer with a cross ⋈.

Information

- The total mark for this paper is 70.
- The marks for **each** question are shown in brackets
 - use this as a guide as to how much time to spend on each question.

Advice

- Read each question carefully before you start to answer it.
- Write your answers neatly and in good English.
- Try to answer every question.
- Check your answers if you have time at the end.

^{*} The lanthanoids (atomic numbers 58-71) and the actinoids (atomic numbers 90-103) have been omitted.

The relative atomic masses of copper and chlorine have not been rounded to the nearest whole number.

Answer	ALL	questions	•
--------	-----	-----------	---

- 1 This question is about gases in the atmosphere.
 - (a) The box gives the names of some gases in the atmosphere.

argon carbon dioxide helium nitrogen oxygen

Use gases from the box to answer the questions.

Each gas may be used once, more than once or not at all.

(i) Identify the two noble gases.

(1)

(ii) Identify the gas that is a compound.

(1)

(iii) Identify the most abundant gas in the atmosphere.

(1)

(iv) Identify the greenhouse gas.

(1)

(b) Describe the test for oxygen.

(1)

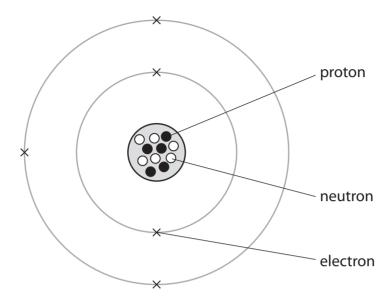

(Total for Question 1 = 5 marks)

2 The diagram represents an atom of boron.

(a) Use information from the diagram to complete the table.

The first row has been done for you.

(5)

atomic number	5
mass number	
number of neutrons	
group in the Periodic Table that contains boron	
period in the Periodic Table that contains boron	
electronic configuration of an atom of boron	

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

(b) Boron has two isotopes, boron-10 and boron-11.

A sample of boron contains 18.7% of boron-10 and 81.3% of boron-11.

Calculate the relative atomic mass of this sample of boron.

(2)

relative atomic mass =

- **3** Crude oil is an important source of organic compounds.
 - (a) The diagram shows crude oil being separated into different fractions.

(i) Name the process used to separate crude oil into different fractions.

(1)

(ii) State what happens to the crude oil at X.

(1)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

 (iii) Describe the differences between fraction B and fraction E. In your answer, refer to size of the molecules boiling point 	
colourviscosity	(4)
(b) Crude oil often contains sulfur as an impurity. Explain why this is a problem when using crude oil fractions as fuels.	(2)
(Total for Question 3 =	8 marks)

BLANK PAGE

- This question is about the halogens and their compounds.
 - (a) The table gives the colour and physical state at room temperature of the halogens.

Complete the table by predicting the colour of a tatine and the physical state of fluorine at room temperature.

(2)

Halogen	Colour	Physical state at room temperature
fluorine	pale yellow	
chlorine	pale green	gas
bromine	red-brown	liquid
iodine	dark grey	solid
astatine		solid

(b) Chlorine gas is bubbled into a colourless solution of potassium bromide.

Explain why the solution turns orange.

(2)

(c) Potassium bromide is an ionic compound.

Draw diagrams to show the outer electrons in a potassium ion and in a bromide ion.

Include the charges on the ions.

(3)

potassium ion	bromide ion

(d) A student sets up a circuit to test the electrical conductivity of water, solid sodium chloride and aqueous sodium chloride.

The table shows the student's results.

Substance	Conducts electricity?
water	no
solid sodium chloride	no
aqueous sodium chloride	yes

Explain these results, with reference to the structure and bonding of the substan	(5)

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

(e) A concentrated aqueous solution of sodium chloride is electrolysed using graphite electrodes.	
Chlorine is formed at the positive electrode (anode).	
(i) Give an ionic half-equation for the formation of chlorine at the positive e	electrode. (1)
(ii) State why this ionic half-equation represents an oxidation reaction.	(1)
(iii) Which substance is formed at the negative electrode (cathode)? A hydrogen	(1)
■ B oxygen	
■ D water	
(Total for Question 4 =	15 marks)

5 This question is about the reactions of carboxylic a	cids.	
--	-------	--

- (a) Carboxylic acids react with solutions of metal carbonates.
 - (i) Complete the chemical equation for the reaction of ethanoic acid, CH₃COOH, with potassium carbonate solution.

(2)

$$2CH_3COOH + K_2CO_3 \rightarrow \dots + \dots + \dots + \dots + \dots$$

(ii) State what you would see in this reaction.

(1)

(b) The ester, ethyl ethanoate, can be prepared by reacting ethanol with ethanoic acid.

This is the method for the preparation.

- mix equal amounts of ethanoic acid and ethanol in a boiling tube
- add a few drops of concentrated sulfuric acid
- place the boiling tube in a hot water bath for several minutes
- (i) State the role of concentrated sulfuric acid in this reaction.

(1)

(ii) Suggest why the mixture is heated in a water bath rather than directly with a Bunsen burner flame.

(1)

(iii) State how you would know that ethyl ethanoate has formed.

(1)

DO NOT WRITE IN THIS AREA

- (c) Another ester, methyl propanoate, can be prepared by reacting methanol with propanoic acid.
 - (i) Draw the displayed formulae of methanol, propanoic acid and the ester, methyl propanoate.

(3)

methanol	propanoic acid		

methyl propanoate

(ii) Give the name of the other product of this reaction.

(1)

(d) Give one use of esters.

(1)

(Total for Question 5 = 11 marks)

BLANK PAGE

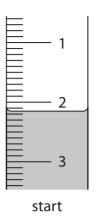

DO NOT WRITE IN THIS AREA

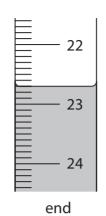

DO NOT WRITE IN THIS AREA

		a bottle of wine is left open for several days, some of the ethanol in the wine			
	turns	to ethanoic acid, CH₃COOH			
(a) A scientist uses a titration method to investigate how much ethanoic acid is formed if a bottle of white wine is left open for one week.					
	SI	he uses this method.			
	•	fill a burette with the white wine and record the reading add 25.0 cm ³ of sodium hydroxide solution to a conical flask add a few drops of phenolphthalein indicator to the flask swirl the flask continuously while adding wine from the burette			
	•	add the wine drop by drop near the end point			
	•	record the reading at the end point			
	(i)	Name the piece of apparatus that would be most suitable for measuring the 25.0 cm ³ of sodium hydroxide solution.			
			(1)		
	(ii	i) Suggest why red wine would not be suitable to use for this investigation.	(1)		
	(ii)	ii) State why she swirls the flask continuously.	(1)		
			(1)		
	(iv	v) State why she adds the wine drop by drop near the end point.	(1)		

(b) The diagram shows the burette readings at the start and end of one of the titrations.

Use the readings to complete the table.

Give your values to the nearest 0.05 cm³.

(3)

burette reading at end	
burette reading at start	
volume of wine added in cm ³	

(c) The scientist repeats the titration four more times.

The table shows her results for these four titrations.

titration number	1	2	3	4
volume of wine added in cm ³	20.40	20.10	20.35	20.45
concordant results				

Concordant results are those within 0.20 cm³ of each other.

(i) Add ticks (\checkmark) to the table to show the concordant results.

(1)

(ii) Use your ticked results to calculate the mean (average) volume of wine added.

(2)

mean volume of wine added = cm³

(d) Another scientist repeats the titration with a different bottle of white wine that has been left open for a week.

The equation for the reaction that occurs in this titration is

$$CH_3COOH + NaOH \rightarrow CH_3COONa + H_2O$$

The mean volume of wine added is 19.50 cm³.

(i) The concentration of the sodium hydroxide solution is 0.0500 mol/dm³.

Calculate the amount, in moles, of NaOH in 25.0 cm³ of sodium hydroxide solution.

(2)

amount of NaOH = mol

(ii) Deduce the amount, in moles, of CH₃COOH in 19.50 cm³ of the wine.

(1)

amount of CH₃COOH = mol

(iii) Calculate the concentration, in mol/dm³, of CH₃COOH in the wine.

(2)

concentration of CH₃COOH = mol/dm³

(Total for Question 6 = 15 marks)

7 Hydrogen gas can be produced by reacting a mixture of methane and steam in the presence of a nickel catalyst.

The reaction conditions are a temperature of 700 °C and a pressure of 5 atmospheres.

The equation for the reaction is

$$CH_4(g) + H_2O(g) \rightleftharpoons CO(g) + 3H_2(g)$$
 $\Delta H = +206 \text{ kJ/mol}$

(a) What does the symbol \rightleftharpoons represent?

(1)

(b) (i) The mixture of methane and steam is heated to a temperature greater than 700 °C but the pressure is kept at 5 atmospheres.

Predict the effect of this change on the yield of hydrogen at equilibrium, giving a reason for your answer.

(2)

(ii) The mixture of methane and steam is kept at the same temperature of 700 °C but the pressure is increased to more than 5 atmospheres.

Predict the effect of this change on the yield of hydrogen at equilibrium, giving a reason for your answer.

(2)

DO NOT WRITE IN THIS AREA
