## **CAMBRIDGE INTERNATIONAL EXAMINATIONS**

**Cambridge International General Certificate of Secondary Education** 

## MARK SCHEME for the October/November 2014 series

## 0460 GEOGRAPHY

0460/41

Paper 4 (Alternative to Coursework), maximum raw mark 60

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge will not enter into discussions about these mark schemes.

Cambridge is publishing the mark schemes for the October/November 2014 series for most Cambridge IGCSE<sup>®</sup>, Cambridge International A and AS Level components and some Cambridge O Level components.

			Cambridge IGCSE – October/November 2014	0460	41
l (a	a)	(i)	Constructive wave: waves far apart and breaking wave spills forwa Destructive wave: waves close together and breaking wave plunge 4 correct labels = 2 marks 2 or 3 correct labels = 1 mark 1 correct label = 0 marks		ds [2]
		(ii)	Use marker pole / rock / person as fixed point Count number of waves breaking in 1 minute / fixed period of time / count float going up and down in 1 minute Use watch / chronometer (for timing)	specified	time /
			Repeat counting / do counting more than once		[3]
(I	b)	(i)	7		[1]
		(ii)	2 plots at frequency 15 on beach A		[1]
	(	(iii)	Beach A: destructive Beach B: constructive		[1]
((	c)	(i)	Put tape measure on beach / poles at bottom and top of beach to create profile / transect line  Measure / mark out distance between ranging poles / every 10 m  Identify sections of the beach profile / breaks of slope  Students hold poles at either end of measured distance / identified section  Make sure they are vertical / same depth / on surface  Student holds clinometers next to top / at specific height on ranging pole / rope at same height on both poles  Sight other ranging pole at top / specific height  Allow clinometers to adjust to angle / read angle / measure gradient  Repeat along transect / repeat for different sections  [4]		
		(ii)	Hypothesis is <b>true</b> – 1 mark reserve		
			At beach A steeper profile and higher wave frequency / at beach B lower wave frequency	gentler pro	file and
			At beach A frequency is 11–15 waves per minute and reaches heig $2.5\mathrm{m}$ , at beach B frequency is 6–8 waves per minute and reaches $1\mathrm{m}$ / less than $1.5\mathrm{m}$		

Mark Scheme

Syllabus

**Paper** 

	Cambridge IGCSE – October/November 2014	0460	41		
(iii	Destructive waves create steeper profile / constructive waves create gentler profile				
	Steeper profile: Destructive / strong / powerful / more frequent waves take material to back of beach / backwash takes smaller material back down beach OR Gentler profile: Constructive / gentle / less frequent waves push material up beach / little backwash to pull material back down [2]				
(d) (i		I / regular distances along transect / measured distance (e.g. 20 m) / equal es / every 10 <sup>th</sup> pebble / every 10 seconds / pick up pebble every metre naterial touching tape o select material			
(ii	Use ruler / pebbleometer / callipers Measure long axis / longest side		[2]		
(iii	Plot bars: 9 cm at pebble 13 on beach A 10.5 cm at pebble 15 on beach B	@ 1	[2]		
(iv	Hypothesis is <b>false</b> / beach material is not larger where wave frequent mark reserve	iency is hig	her – 1		
	Pebbles smaller / average size / median size is smaller at beach A frequency is higher OR Pebbles larger / average size / median size is larger at beach I frequency is lower OR Similar size pebbles on both beaches				
	Beach A average size = 9.5 cm, at Beach B = 10 cm Beach A median size = 9 cm, at beach B = 9.5 cm Credit 1 mark maximum for comparative figures		[3]		
Ò	(e) Classify types of pollution / decide types of pollution / observe or see types of pollution Create environmental index / bi-polar index Explanation of how index is used				

**Mark Scheme** 

Page 3

**Total 30 marks** 

[3]

**Syllabus** 

Paper

Count pieces of litter / estimate area of oil / sewage coverage / weigh litter / tally

Decide on sampling method / quadrat / transect

Photographs of types of pollution / polluted areas

(a)	Major road junction / bus station /railway station / most traffic Peak land value point / highest land value Historic building or site e.g. church / square / monument / oldest building Town hall / government buildings			
	2 @	@ 1		[2]
(b)	(i)	20 minutes is long enough to give a reasonable result / fair t Students will not get bored if longer time Consistency / greater reliability of results because all counts All done at once / fieldwork completed quickly		[2]
	(ii)	Recording sheet should include: Street name / location / place / sample point / site / space fo Tally of pedestrians / space to do tally / amount / count Total number / result of tally	r lots of points	[3]
(c)	(i)	Completion of isoline on Fig. 5 (-1 for each error)		[2]
	(ii)	Shading on Fig. 5		[1]
	(iii)	Hypothesis is <b>true</b> / pedestrian flow does decrease – 1 mark	( reserve	
		Detailed / accurate comparison:  Over 200 at centre and less than 50 at the edge = 2 marks  Over 200 at centre and 102 at 0.5 km = 2 marks		
		Weak comparison: 200 at centre and 50 at edge / by motorway / by river = 1 ma 200 at centre and decreasing to 100 = 1 mark	ark	[3]
	(iv)	Pedestrian numbers would increase		[1]
	(v)	Reasons <b>must link</b> to more / many or less / few people:		
		Shopping centre / shops / services Bus station / railway station Tourist / entertainment attractions / historic attractions / park Offices / workplaces / industries / businesses Housing (e.g. high rise blocks of flats) Pedestrianised zone 2 @ 1	S	[2]

Mark Scheme

Syllabus 0460 Paper 41

Page 5	Mark Scheme	Syllabus	Paper
	Cambridge IGCSE – October/November 2014	0460	41
(d) (i)	Easy / quick to count number of storey (than measure height) Difficult to measure actual height of tall buildings Each storey is approximately same height More storeys the higher the building will be		[1]
(ii)	3 (must be whole number)		[1]
(iii)	Completion of bar using key = 4 storeys at location X		[1]
(iv)	(iv) Hypothesis is <b>false</b> – tallest buildings are not in CBD – 1 mark reserve		
	Tallest buildings are outside / west of CBD / near motorway / near	market	
	Tallest buildings in CBD are 4 storeys high and tallest buildings our storeys high	tside CBD a	re 5 / 6 [3]
(v)	Cost of land / higher costs = taller buildings Competition for / availability of land for building / less space = taller Proximity to transport routes / e.g. taller buildings near motorway Ages of buildings / historical areas are lower New developments of high-rise offices or apartments Building regulations / laws restricting building height	r buildings	
	Different land uses / examples of two land uses	2@1	[2]
` '	Find out the land value (rateable value) Identify types of land use 2 @ 1		
Do Mo Do	destrian flows:  survey later in the day / different times of day bre survey locations survey on a non-work day / weekend bre students at each location to check accuracy		

Use of counters / 'clickers' Ensure each pair has watch / stopwatch for accurate timing

## Average building heights:

More than 10 / all buildings at each sample point More data collection locations More students at each location to check accuracy Obtain secondary data of building heights Measure height of buildings using trigonometry

Do a practice investigation – for either investigation

1 mark reserve for each investigation. No double credit.

**Total 30 marks**
